

Build Your Own AI Operating System (Master Prompt)

STEP 1

Who are you?

Don't write your job title.

Write your mission.

Example questions:

What do you believe?

Why did you start?

What frustrates you?

What change are you trying to create?

What kind of person are you becoming?

STEP 2

Who do you help?

Avoid everyone.

Instead answer:

Who struggles today?

What stage are they in?

What have they already tried?

What do they secretly want?

STEP 3

What transformation do you create?

Don't describe your product.

Describe the outcome.

Instead of:

I sell AI software.

Write:

I help busy business owners save hours every week using AI.

STEP 4

What principles guide your business?

Complete these sentences.

I believe...

I never...

I always...

Success comes from...

People struggle because...

These become your decision-making framework.

STEP 5

Teach ChatGPT how to think

Instead of asking for answers...

Tell ChatGPT how to reason.

For example:

Challenge weak ideas.

Think like a marketer.

Simplify everything.

Find blind spots.

Question assumptions.

Think long term.

STEP 6

Teach ChatGPT your writing style

Should it sound...

Professional?

Friendly?

Funny?

Direct?

Educational?

Authoritative?

Minimal?

Write those rules once.

Every future response improves.

STEP 7

Define your content strategy

What should every piece of content achieve?

Examples:

Build trust.

Generate leads.

Educate.

Create curiosity.

Increase authority.

Invite conversation.

STEP 8

Create a Quality Filter

Before ChatGPT answers, tell it to check:

Is this clear?

Is it useful?

Is it accurate?

Is it simple?

Would beginners understand it?

Does it actually solve the problem?

STEP 9

Define ChatGPT's role

Never make ChatGPT "an AI assistant."

Instead, assign it a role.

Examples:

Senior business strategist

Marketing director

Copy chief

Product designer

Brand consultant

Prompt engineer

Course architect

The better the role, the better the thinking.
